Question 1

Correct

Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that  $A[i] - A[j] = k$ ,  $i \neq j$ .

Input Format

1. First line is number of test cases T. Following T lines contain:
2. N, followed by N integers of the array
3. The non-negative integer k

Output format

Print 1 if such a pair exists and 0 if it doesn't.

Example

Input:

1  
3 1 3 5  
4

Output:

1

Input:

1  
3 1 3 5  
99

Output:

0

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2
3 int main(){
4     int t;
5     scanf("%d",&t);
6
7     while(t--) {
8         int n, k, arr[100000], found = 0;
```

```

9     scanf("%d",&n);
10    for(int i=0;i<n;i++) scanf("%d",&a[i]);
11    scanf("%d",&k);
12
13    for (int i = 0;i<n && !found; i++)
14        for(int j = i+1;j<n;j++)
15            if(a[i] - a[j] == k || a[j] - a[i] == k)
16                found = 1;
17
18    printf("%d\n" , found);
19
20}

```

	<b>Input</b>	<b>Expected</b>	<b>Got</b>	
✓	1 3 1 3 5 4	1	1	✓
✓	1 3 1 3 5 99	0	0	✓

Passed all tests! ✓

## Question 2

Correct

Sam loves chocolates and starts buying them on the 1st day of the year. Each day of the year,  $x$ , is numbered from 1 to  $Y$ . On days when  $x$  is odd, Sam will buy  $x$  chocolates; on days when  $x$  is even, Sam will not purchase any chocolates.

Complete the code in the editor so that for each day  $N_i$  (where  $1 \leq x \leq N \leq Y$ ) in array  $arr$ , the number of chocolates Sam purchased (during days 1 through  $N$ ) is printed on a new line. This is a function-only challenge, so input is handled for you by the locked stub code in the editor.

### Input Format

The program takes an array of integers.

The locked code in the editor handles reading the following input from `stdin`, assembling it into an array of integers ( $arr$ ), and calling `calculate(arr)`.

The first line of input contains an integer,  $T$  (the number of test cases). Each line  $i$  of the  $T$  subsequent lines describes the  $i$ th test case as an integer,  $N_i$  (the number of days).

### Constraints

$$1 \leq T \leq 2 \times 10^5$$

$$1 \leq N \leq 2 \times 10^6$$

$$1 \leq x \leq N \leq Y$$

### Output Format

For each test case,  $T_i$  in  $arr$ , your `calculate` method should print the total number of chocolates Sam purchased by day  $N_i$  on a new line.

### Sample Input 0

```
3
1
2
3
```

### Sample Output 0

```
1
1
4
```

## Explanation

### Test Case 0: N = 1

Sam buys 1 chocolate on day 1, giving us a total of 1 chocolate. Thus, we print 1 on a new line.

### Test Case 1: N = 2

Sam buys 1 chocolate on day 1 and 0 on day 2. This gives us a total of 1 chocolate. Thus, we print 1 on a new line.

### Test Case 2: N = 3

Sam buys 1 chocolate on day 1, 0 on day 2, and 3 on day 3. This gives us a total of 4 chocolates. Thus, we print 4 on a new line.

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2
3 int main() {
4     int t;
5     scanf("%d" , &t);
6
7     while(t--) {
8         long long n,sum=0;
9         scanf("%lld" , &n);
10
11         for (long long i = 1;i <= n; i+= 2)
12             sum += i;
13         printf("%lld\n" , sum);
14     }
15
16     return 0;
17 }
```

### Question 3

Correct

The number of goals achieved by two football teams in matches in a league is given in the form of two lists. Consider:

- Football team A, has played three matches, and has scored { 1 , 2 , 3 } goals in each match respectively.
- Football team B, has played two matches, and has scored { 2, 4 } goals in each match respectively.
- Your task is to compute, for each match of team B, the total number of matches of team A, where team A has scored less than or equal to the number of goals scored by team B in that match.
- In the above case:
  - For 2 goals scored by team B in its first match, team A has 2 matches with scores 1 and 2.
  - For 4 goals scored by team B in its second match, team A has 3 matches with scores 1, 2 and 3.

Hence, the answer: {2, 3}.

Complete the code in the editor below. The program must return an array of m positive integers, one for each maxes[i] representing the total number of elements nums[j] satisfying  $\text{nums}[j] \leq \text{maxes}[i]$  where  $0 \leq j < n$  and  $0 \leq i < m$ , in the given order.

It has the following:

`nums[nums[0],...nums[n-1]]`: first array of positive integers  
`maxes[maxes[0],...maxes[n-1]]`: second array of positive integers

Constraints

- $2 \leq n, m \leq 105$
- $1 \leq \text{nums}[j] \leq 109$ , where  $0 \leq j < n$ .
- $1 \leq \text{maxes}[i] \leq 109$ , where  $0 \leq i < m$ .

Input Format For Custom Testing

Input from `stdin` will be processed as follows and passed to the function.

The first line contains an integer n, the number of elements in `nums`.

The next n lines each contain an integer describing `nums[j]` where  $0 \leq j < n$ .

The next line contains an integer m, the number of elements in `maxes`.

The next m lines each contain an integer describing `maxes[i]` where  $0 \leq i < m$ .

Sample Case 0

Sample Input 0

```
4  
1  
4  
2  
4  
2  
3  
5
```

#### Sample Output 0

```
2  
4
```

#### Explanation 0

We are given  $n = 4$ ,  $\text{nums} = [1, 4, 2, 4]$ ,  $m = 2$ , and  $\text{maxes} = [3, 5]$ .

1. For  $\text{maxes}[0] = 3$ , we have 2 elements in  $\text{nums}$  ( $\text{nums}[0] = 1$  and  $\text{nums}[2] = 2$ ) that are  $\leq \text{maxes}[0]$ .
2. For  $\text{maxes}[1] = 5$ , we have 4 elements in  $\text{nums}$  ( $\text{nums}[0] = 1$ ,  $\text{nums}[1] = 4$ ,  $\text{nums}[2] = 2$ , and  $\text{nums}[3] = 4$ ) that are  $\leq \text{maxes}[1]$ .

Thus, the function returns the array  $[2, 4]$  as the answer.

#### Sample Case 1

#### Sample Input 1

```
5  
2  
10  
5  
4  
8  
4  
3  
1  
7  
8
```

#### Sample Output 1

```
1  
0
```

3  
4

### Explanation 1

We are given, n = 5, nums = [2, 10, 5, 4, 8], m = 4, and maxes = [3, 1, 7, 8].

1. For maxes[0] = 3, we have 1 element in nums (nums[0] = 2) that is  $\leq$  maxes[0].
2. For maxes[1] = 1, there are 0 elements in nums that are  $\leq$  maxes[1].
3. For maxes[2] = 7, we have 3 elements in nums (nums[0] = 2, nums[2] = 5, and nums[3] = 4) that are  $\leq$  maxes[2].
4. For maxes[3] = 8, we have 4 elements in nums (nums[0] = 2, nums[2] = 5, nums[3] = 4, and nums[4] = 8) that are  $\leq$  maxes[3].

Thus, the function returns the array [1, 0, 3, 4] as the answer.

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2 int main() {
3     int n,m;
4     scanf("%d",&n);
5
6     int nums[n];
7     for (int i = 0; i < n; i++) {
8         scanf("%d" , &nums[i]);
9     }
10
11    scanf("%d" , &m);
12    int maxes[m];
13    for(int i=0;i<n;i++) {
14        scanf("%d",&maxes[i]);
15    }
16
17    for (int i = 0;i<m;i++) {
18        int count = 0;
19        for (int j = 0; j<n; j++) {
20            if (nums[j] <= maxes[i]) {
21                count++;
22            }
23        }
24
25        printf("%d\n",count);
26    }
27
28    return 0;
29 }
30 }
```
